Final Project Presentation and Product

**College of Engineering and Computer Science,
COMP1020 Object-Oriented Programming & Data Structures Spring 2026**

Objectives

This assessment evaluates students' ability to design, implement, and communicate a complete software system using Object-Oriented Programming (OOP), data structures, and algorithms. Students are expected to develop a functional and usable application that demonstrates correct program behavior, applies core OOP principles, and integrates appropriate data structures and algorithms to solve computational problems effectively.

The submission also assesses code quality, including structure, readability, and maintainability, as well as the ability to justify key design and architectural decisions. In addition, students must clearly demonstrate the working system and communicate its features and design through a recorded presentation and supporting materials.

This submission accounts for **15%** of the total course grade and is composed of three components:

1. Recorded Video Presentation (**5%**)
2. Poster Session (**5%**)
3. Final Product (**5%**)

1. Recorded Video Presentation

Guideline: Each team must prepare a video presentation to demonstrate the completed project. The video should clearly explain the project, including the main features and functionalities, system workflow, and a demonstration of the application.

The recommended video duration is **5–8 minutes**. The video must be uploaded to the class Facebook Group. Teams may use platforms such as YouTube or Google Drive to host the video, provided that the shared link remains accessible until the grading process is completed. Finally, submit the video link in the designated **Canvas** assignment before the deadline.

Requirements: The presentation should integrate both technical explanation and system demonstration, highlighting key design decisions and implementation outcomes.

Category	Requirements
Technical Content	Project overview, objectives, and motivation; explanation of system features and workflow; demonstration of the working application (teams must show the actual running system); discussion of key OOP concepts, data structures, algorithms, and architectural design; project limitations.
Presentation Quality	Clear and well-structured delivery, logical organization of content, effective communication of key ideas, clear narration, and a screen recording where the application interface and text can be viewed clearly.
Team Participation	All team members are expected to actively participate and contribute to the presentation.

Important Dates

- **Deadline of Recorded Video Submission: 11:59 PM, June 2, 2026**

2. Poster Session

Guideline: Each team must complete the following steps for the poster presentation:

1. *Submit Poster (PDF)*: Upload the final poster in PDF format via **Canvas** by the designated deadline.
2. *Print Poster*: Printed posters will be prepared with support from the teaching team based on the submitted PDF.
3. *Poster Presentation*: Present and explain the poster during the assigned poster session at the designated time and date. Teams must be prepared to discuss their system design, implementation, and evaluation.

Requirements

Category	Details
Content	Problem statement and objectives; system architecture and design; key features with screenshots; application of OOP concepts and data structures; algorithms and implementation highlights; testing and evaluation results; conclusion and possible future improvements.
Format	A0 poster size in either portrait or landscape orientation. Students must submit a digital PDF version. The teaching team will handle printing. Content should be concise, visual, and easy to read.
Design Tips	Use diagrams, screenshots, workflow illustrations, tables, and charts where appropriate. Avoid excessive text and prioritize visual explanation.
Presentation	All team members must participate. Teams should be prepared to explain system design, OOP and data structure choices, answer technical questions, and provide a short live demonstration if requested.

Important Dates

- **Deadline of Poster PDF Submission:** **11:59 PM, June 2, 2026**
- **Poster Printing and Collection:** Teams only need to submit the poster file. The teaching team will print all posters after submission. Printed posters will be available for collection on the morning of **June 4, 2026**. The exact time and location to pick up will be announced later.
- **Poster Presentation Session:** All teams will present their posters on **June 4, 2026**, from **1:30 PM to 3:00 PM**. The exact location will be announced later.

3. Final Product

Guideline:

Each team must submit a reproducible project package via **Canvas** as a compressed archive (e.g., .zip, .tar.gz, or similar format) containing the complete source code, required resources, and instructions for running the project.

Requirements: The submission must enable the Java application to be built, executed, and evaluated without additional setup beyond the provided instructions. Specifically, the submission must include:

- Well-structured Java source code organized into appropriate packages, demonstrating clear OOP design (e.g., encapsulation, inheritance, polymorphism, and abstraction where applicable).
- Clear build and run instructions (e.g., using an IDE or command line) or an executable JAR file, including all required dependencies and configuration files.
- Sample input/output data or test scenarios demonstrating key system functionalities (e.g., use cases for a management system or gameplay scenarios for a game project).
- A short implementation note (README-style) describing project structure, execution steps, and any special requirements or design decisions.
- (Optional) A GitHub repository link, please ensure that access permissions are properly configured.

Important Dates

- **Deadline of Final Product Submission: 11:59 PM, June 2, 2026**
